

Progress 12

- ☒ ~~Design Final Screen UI~~
- ☒ ~~Integrate failed screen into flow~~
- ☒ ~~Display top 3 recs in app~~
- ☒ ~~Options to see all recs in app~~

Work Done:

- It turns out that the filtering was not working correctly. Because if someone had normal skin and no skin quirks the 'bad ingredients' needing filtering out would be blank. As all product have something in 'made without' as blank is = n/a this meant that many cases were not producing any outputs.
- I found that I can use the startup function to pass the information I want on the final screen allowing users to see their recommendations without having to press any buttons.
- I tried to load the images with their urls and could not figure out how. I then decided to download all the images and store them locally but ultimately ran out of time and decided the UI was too crowded anyway.

Test Cases

Inputs						Output
How old are you?	What is your skin type?	Does your skin have any quirks?	What type of product are you in the market for?	What do you want to target	What is the most you're winning to spend	Expect final output screen
303	Normal	Psoriasis	Moisturiser	Aging	65	
10	Oily	Sensitive	Treatment	Texture	90	
31	Combination	None	Lip Care	Dehydration	30	
31	Normal	None	Lip Care	Dehydration	30	

Reflection

All in all I am pretty happy with how this turned out. If i had more time I would have worked on integrating images and taking the user to a final screen that would allow them to proceed or exit to reduce the amount of assets on the final screen.
